Functional Block Diagram

General Description

The TQP3M9035 is a high-linearity, low noise gain block amplifier in a low-cost surface-mount package. At 1900 MHz, the amplifier typically provides 16.5 dB gain, +37 dBm OIP3, and 0.65 dB Noise Figure. The LNA is also designed to be broadband without the requirement for external matching. The device is housed in a lead-free/green/RoHS-compliant industry-standard 2x2 mm package.

The TQP3M9035 has the benefit of having high linearity while also providing very low noise across a broad range of frequencies. This allows the device to be used in both receive and transmit chains for high performance systems. The amplifier is internally matched using a high performance E-pHEMT process and only requires an external RF choke and blocking/bypass capacitors for operation from a single +5V supply. The low noise amplifier integrates a shut-down biasing capability to allow for operation for TDD applications.

The TQP3M9035 covers the 50-4000 MHz frequency band and is targeted for wireless infrastructure or other applications requiring high linearity and/or low noise figure.

TQP3M9035-PCB Evaluation Board

Notes:

- 1. See Evaluation Board PCB Information section for material and stack-up.
- 2. R3 (0 Ω jumper) is not shown on the schematic and may be replaced with copper trace in the target application layout.
- 3. All components are of 0402 size unless stated on the schematic.
- 4. C1, C2, and C3 are non-critical values. The reactive impedance should be as low as possible at the frequency of operation for optimal performance.
- 5. The L1 value is non-critical and needs to provide high reactive impedance at the frequency of operation.
- 6. R1 and R2 are optional and do not need to be loaded if the shut-down functionality is not needed; i.e. FDD applications. If R1 and R2 are not loaded, the LNA will operate in its standard "ON" state.
- 7. A through line is included on the evaluation board to de-embed the board losses.

50-500 MHz IF Reference Design

TQP3M9035 performance may be optimized for IF operation below 500 MHz by making suitable adjustments to the value of the bias inductor L1 and the DC blocking capacitors C1 and C2. When using the TriQuint evaluation board be sure to match the value of C5 and C6 to that of C1 and C2 for accurate loss de-embedding.

Pin Configuration and Description

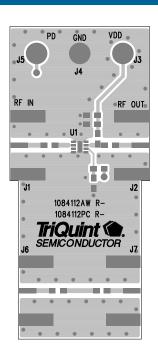

Pin No.	Label	Description
2	RF In	RF Input pin. A DC Block is required.
6	Shut Down	A high voltage turns off the device. If the pin is not connected or is less than 1V, then the device will operate under its normal operating condition.
7	RF Out / DCBias	RF Output pin. DC bias will also need to be injected through a RF bias choke/inductor for operation.
1, 3, 4, 5, 8	NC	No electrical connection. Provide grounded land pads for PCB mounting integrity.
Backside Paddle	RF/DC GND	RF/DC ground. Use recommended via pattern to minimize inductance and thermal resistance; see PCB Mounting Pattern for suggested footprint.

Mechanical Information

Package Marking and Dimensions

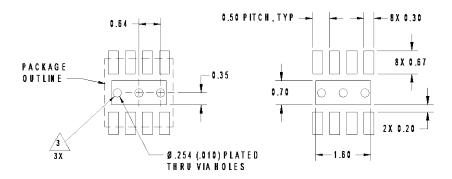

Marking: Part number – 9035 Lot Code – XXXX

NOTES:

- 1. All dimensions are in millimeters. Angles are in degrees.
- 2. Except where noted, this part outline conforms to JEDEC standard MO-220, Issue E (Variation VGGC) for thermally enhanced plastic very thin fine pitch quad flat no lead package (QFN).
- 3. Dimension and tolerance formats conform to ASME Y14.4M-1994.
- 4. The terminal #1 identifier and terminal numbering conform to JESD 95-1 SPP-012.

PCB Mounting Pattern

NOTES:

- 1. All dimensions are in millimeters. Angles are in degrees.
- 2. Use 1 oz. copper minimum for top and bottom layer metal.
- 3. Vias are required under the backside paddle of this device for proper RF/DC grounding and thermal dissipation. We recommend a 0.35mm (#80/.0135") diameter bit for drilling via holes and a final plated thru diameter of 0.25 mm (0.10").
- 4. Ensure good package backside paddle solder attach for reliable operation and best electrical performance.
